
Fit is frozen at the delivered reference

Last capture: 0.55 s
Arrival / freeze: 0.85 s
Only adjacent, powered, delivered samples

v(next) = alpha v(now) + beta
I = torque dt alpha / beta
d = I (1/alpha - 1) / dt

Delivered history

Capture / arrival timestamps
Public velocity and power
No hidden fault or response

Response support

Freeze the public OLS fit
Fixed numerical neighborhood
No hardware coverage claim

Matched branch admission

Full: success + failure paths
Success-only: nominal path
Same fit, queue and windows

Independent physical score

Actual native completion
A deadline + B window
Preserve failures and harms

Restricted noiseless rotor family; numerical response identification is a deterministic strong baseline, not evidence of a learned robot policy.
